

SALES ENABLEMENT

Sell the model, not the scan.

Every OT security vendor in the room is selling visibility. We are selling something a buyer has never been offered: a working replica of their plant that we can attack, change and price before anyone touches production. This sheet is how to say that in their language.

AUDIENCE	OXOT sales, pre-sales and partner teams — not for customer distribution
LEAVE BEHIND	Product Sheet (7pp) for the buying group · Specification Sheet (5pp) for architects and engineers
ASK FOR	Single Facility; Facility Layout Diagram, High Level Design, P&ID, Network Diagram, Asset list, Safety, Reliability or Operation Requirements (Impact/Consequence). That is the whole first ask.

01 · THE THIRTY SECONDS

"You already carry the cyber risk of your plants on your own balance sheet, and nobody has priced it. We build a computable replica of a facility from your own engineering drawings, carrying both what each asset does in the process and what state its software is in. Then we attack the replica instead of the plant, and tell you what it would cost, which change removes the most of it, and what you can safely ignore."

Then stop and ask: *"How do you currently decide which OT security work gets funded first?"*

02 · WHERE WE WIN

Sectors Energy and utilities, water, chemicals and process, food and beverage, pharma, rail and ports, discrete manufacturing at scale.	Profile Multi-site operators with engineering drawings that exist, a named OT security owner, and downtime measured in six figures a day.	Also strong Private equity and corporate development teams buying industrial assets, and the insurers and brokers who underwrite them.
---	---	--

03 · WHO CARES, AND ABOUT WHAT

CISO / OT security	Has a backlog they cannot defend. Wants permission to not fix things — sell NOW / NEXT / NEVER.
Plant manager	Fears the security team touching a running process. Sell passive-first and change tested in the virtual layer.
CFO / board	Cannot judge a maturity score. Sell euros, the Index, and a spend recommendation with a ceiling on it.
Chief architect	Will test whether the model is real. Hand over the Specification Sheet and let them interrogate it.
Compliance	Running a parallel programme. Sell evidence as a by-product of the risk work, not a second project.
M&A / corp dev	On a deal clock. This is what the engine was built for — lead with the origin story, not the platform.

04 • TRIGGER EVENTS

None of these are cyber events. All of them create a buyer who needs a number they do not have.

An acquisition or divestment of industrial assets	A NIS2 or CRA deadline with no evidence base
A multi-year OT security budget under board challenge	A cyber insurance renewal or a declined claim
A segmentation or modernisation programme about to start	An incident at a peer in the same sector
A supplier or vendor found compromised upstream	A new plant, line or country entering the estate

05 • DISCOVERY QUESTIONS THAT OPEN THE DEAL

PRIORITY	"How many open findings are in your OT backlog, and how did you decide the order?"
CONSEQUENCE	"If that PLC were compromised tomorrow, who in the business can tell me what stops running?"
MONEY	"What did you tell the board last cycle about what the spend actually bought them?"
CHANGE	"When you last changed segmentation, how did you know it would work before you did it?"
DRAWINGS	"Do your P&IDs still match the plant, and who would know if they didn't?"
ENGINEERING	"Has anyone joined your FMEA and safety work to your cyber findings?"
THE OPENER	"If you had to insure one of your own plants against a cyber event, what premium would you quote?"

06 • QUALIFY IN

Engineering documentation exists, even if it is out of date
Consequence of downtime is already understood internally
A decision is pending: a budget, a deal, a deadline
Someone senior is tired of being asked to trust a severity score

07 • QUALIFY OUT, HONESTLY

They want live network detection and response — that is not this
Single small site with no engineering record and no drawings
They need a certificate this quarter and nothing more
No one will own the model after we hand it over

Disqualify early and say why.

Our credibility rests on being the people who tell you what not to buy. That has to be true in the sales conversation as well as in the model.

08 • WHAT TO ASK FOR, AND WHEN

FIRST CALL	A technical session with their architect and safety lead — not a procurement conversation
SECOND CALL	One P&ID and an asset list for a single facility. Nothing from the control network
BRING IN	Whoever owns the FMEA and the safety case. They are the reason our loss figures hold up
WATCH FOR	A buyer who wants the number without the model. That deal closes and then disappoints

09 · WHEN THEY ARE ALSO LOOKING AT

OT monitoring vendors	They tell you what is on the network. We tell you what happens if it is used against you. Not a replacement — their inventory feeds our model. Position as the layer above.
Traditional digital twins	Built to optimise operations and assume the plant is intact. Ours is built to find the risk to minimum operations and crown jewels.
Big-four consultancies	Deliver a report that ages from the day it is signed. We leave behind a model that regenerates when the plant changes — and it stays yours.
Cyber risk quantification	Workshop-driven estimates with no mechanism underneath. Our loss figures come from the customer's own FMEA, SCIL and RCIL work, already signed off.
Doing nothing	The real competitor. Counter with the tail: the average year is survivable, and the model exists to find the year that is not.

10 · OBJECTIONS

"We are not putting anything on our control network."
Correct, and neither are we. It is built from documents you send us — no agents, no active scanning. Island mode means no external dependencies at all.
"Our drawings are out of date."
Everyone's are. Reconciling them against reality is part of the engagement, and the gap list is usually the first thing the customer finds valuable.
"How can you put a euro figure on a cyber event?"
We don't. Your engineers already did — in the FMEA severity, the reliability loss and the minimum operating requirements. We inherit those figures and attach them to reachable pathways.
"We already have a monitoring platform."
Good — its inventory is an input. It answers what is there. It cannot tell you which finding to fund first, or what the alternative buys you.
"This sounds like a black box."
Then take it apart. Every figure drills from the Index down to the pathway and the safety function at the end of it, and every source is cited beside the value.
"We have no budget this cycle."
Then start with one facility. The output is a bounded spend recommendation — it is usually the instrument that unlocks the next budget rather than competing with it.

11 · PROOF YOU CAN PUT ON THE TABLE

Co-invested	Built under a deal clock	Standards as structure
The Dutch government and the European Cybersecurity Competence Centre backed the Cyber Digital Twin under CIF-NL 2025.	The engine exists because M&A due diligence would not wait for site-by-site assessment. Speed is in its origin, not its brochure.	IEC 62443 zones and conduits are how the model is partitioned, so compliance evidence is generated rather than assembled.

12 · DEPLOYMENT IS A SELLING LEVER

Island mode Isolated, on their own ground, no external dependencies, no access to control systems, their own custom AI model. Use when security governance is the blocker.	One-way data diode Inbound only. Our intelligence streams in; nothing exits. Use when they want current threat data but no egress.	Dedicated instance Single-tenant in an AWS service of their choice, aligned to their data sovereignty requirements. The default for most estates.
--	--	---

13 · ENGAGEMENT MODELS

Transient — OXOT OT engineering consulting builds and deploys the twin for a one-time engagement
Long-term operations — the twin is sustained alongside the estate as it changes, depending upon Deployment model, this could be continuous or managed directly ever quarter where our engineering team updates the model.
Both are consulting-led. We are not selling software a customer installs alone.

14 · INTEGRATIONS TO NAME

Asset management systems
Historians
Network monitoring platforms
Service management applications

15 · THE MOTION

01 Frame Open on the unpriced position, not on features. Leave the Product Sheet.	02 Prove Technical session with their architect and safety lead. Hand over the Specification Sheet.	03 Model One facility, from one P&ID and an asset list. Small, bounded, real.	04 Expand The Index needs the estate to mean anything. Growth is structural, not upsell.
---	---	---	--

16 · SAY THIS

"Our own transparent calculations, directionally validated on real engagements"
"Monte Carlo simulation, reported with confidence intervals"
"Built from your engineering record, not from probing the plant"
"Bring one P&ID and we will show you what the model finds"

NOT THIS

Never "actuarial", "rating-agency" or "certified" — we are none of those
No invented accuracy figures, hit rates or customer names
Never imply we detect or respond to live attacks
Never promise a timeline before the drawings have been seen

17 · WHERE DEALS STALL, AND WHAT UNSTICKS THEM

No document owner Route through engineering, not security — the drawings are their record.	Security-only sponsor Get the safety or reliability owner in early; the loss figures are theirs.	Procurement framing Scored as a monitoring tool. Reframe as engineering consulting.	Waiting for an incident Return to the tail: the year that does not look like the average one.
--	--	---	---

One environment. One evolving model.
Better security decisions.

Internal document. Do not distribute to customers or partners outside OXOT.
